Aim: To implement midpoint circle algorithm.

Objective:

Draw a circle using mid-point circle drawing algorithm by determining the points needed for rasterizing a circle. The mid-point algorithm to calculate all the perimeter points of the circle in the first octant and then print them along with their mirror points in the other octants.

Theory:

The shape of the circle is similar in each quadrant. We can generate the points in one section

and the points in other sections can be obtained by considering the symmetry about x-axis and y-axis.

The equation of circle with center at origin is $x^2 + y^2 = r^2$

Let the circle function is $f_{\text{circle}}(x, y)$ -

f_{circle} is < 0 , if (x, y) is inside circle boundary,

f_{circle} is $= 0$, if (x, y) is on circle boundary,

f_{circle} is > 0 , if (x, y) is outside circle boundary.

Consider the pixel at (x_k, y_k) is plotted,

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

Now the next pixel along the circumference of the circle will be either $(x_k + 1, y_k)$ or $(x_k + 1, y_k - 1)$ whichever is closer the circle boundary.

Let the decision parameter p_k is equal to the circle function evaluate at the mid-point between

two pixels.

If $p_k \leq 0$, the midpoint is inside the circle and the pixel at y_k is closer to the circle boundary.

Otherwise, the midpoint is outside or on the circle boundary and the pixel at $y_k - 1$ is closer to the circle boundary.

Algorithm –

MIDPOINT_CIRCLE(r)

$x=0$

$y=r$

$p=1-r$

EightWaySymmetry(x,y)

putpixel(x,y)

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

putpixel(x,-y)

putpixel(-x,y)

putpixel(-x,-y)

putpixel(y,x)

putpixel(y,-x)

putpixel(-y,x)

putpixel(-y,-x)

while x<y do

if p<0

p=p+2x+3

else

p=p+2x-2y+5

y=y-1

end

x=x+1

end

Program –

```
#include<stdio.h>
```

```
#include<conio.h>
```

```
#include<graphics.h>
```

```
void main()
```

```
{
```

```
int x,y,p,r,xc,yc;
```

```
int gd=DETECT,gm;
```

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

```
initgraph(&gd,&gm,"C:\\TURBOC3\\BGI");  
printf("Enter xc,yc:");  
scanf("%d%d",&xc,&yc);  
printf("Enter radius:");  
scanf("%d",&r);  
x=0;  
y=r;  
p=1-r;  
do  
{  
    putpixel(xc+x,yc+y,RED);  
    putpixel(xc+y,yc+x,RED);  
    putpixel(xc-y,yc+x,RED);  
    putpixel(xc-x,yc+y,RED);  
    putpixel(xc-x,yc-y,RED);  
    putpixel(xc-y,yc-x,RED);  
    putpixel(xc+y,yc-x,RED);  
    putpixel(xc+x,yc-y,RED);  
    if(p<0)  
    {  
        p=p+(2*x)+3;  
    }  
    else  
    {  
        y=y-1;
```

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

```
p=p+(2*x)-(2*y)+1;  
}  
x=x+1;  
}while(y>x);  
getch();  
closegraph();  
}
```

```
Enter xc, yc:300  
200  
Enter r :100
```

Conclusion: Comment on

1. Fast or slow:-It is slow
2. Draw one arc only and repeat the process in 8 quadrants:-It is quite easy to draw only one arc rather than drawing all arcs
3. Difference with line drawing method:-It is difficult than line drawing algorithms
